# 1 Algebra of the Complex Plane

## 1.1 Introduction to Complex Numbers

Let  $z = a + ib \in \mathbb{C}$  where  $a, b \in \mathbb{R}$  and  $i^2 = -1$ .

This number can be thought of as a point in 2-space,  $\mathbb{R}^2$ ,  $(a, b)$  or as a position in  $\mathbb{C}$ .

$\mathbb{R}^2$ :  $\oplus$  addition;  $\odot$  scalar multiplication.

$\mathbb{C}$ :  $\oplus$  addition;  $\odot$  scalar multiplication; a vector space; have multiplication of elements,  $\mathbb{C}$  is a field.

$$\text{If } z = a + ib, w = c + id, \text{ then } zw = (ac - bd) + i(ad + cb)$$

$$zw = wz$$

$$z(w + \alpha) = zw + z\alpha$$

$$(zw)\alpha = z(w\alpha)$$

## 1.2 Conjugate of Complex Numbers

### 1.2.1 Definition of Conjugate

The complex conjugate of  $z$ ,  $\bar{z}$ , is defined by

$$\bar{z} = a - ib$$

Geometric representation: The image of  $\bar{z}$  is the reflection of  $z$  about the Real axis.

### 1.2.2 Properties of Conjugate

$$\overline{\bar{z}} = z$$

$$\overline{zw} = \bar{z}\bar{w}$$

$$\overline{z + w} = \bar{z} + \bar{w}$$

$$\bar{z} = z \text{ if and only if } z \in \mathbb{R}$$

### 1.2.3 Real and Imaginary Parts

We can project  $z$  onto the Real or Imaginary axis and measure its distance from 0:

$$\Re(z) = a$$

$$\Im(z) = b, \text{ not } ib$$

Each function is a map  $\mathbb{C} \rightarrow \mathbb{R}$ . Then

$$\Re(z) = \frac{z + \bar{z}}{2}$$

$$\Im(z) = \frac{z - \bar{z}}{2i}$$

This is similar to the pattern with even/odd functions.

## 1.3 Modulus of Complex Numbers

Note:  $z\bar{z} = (a + ib)(a - ib) = a^2 + b^2 \in \mathbb{R}$

### 1.3.1 Definition of Modulus

$|z|$  length/modulus of  $z$  is defined by:

$$|z| = (a^2 + b^2)^{\frac{1}{2}} = (z\bar{z})^{\frac{1}{2}} \in \mathbb{R}$$

### 1.3.2 Properties of Modulus

$$|zw| = |z||w|$$

$$|z| = |\bar{z}|$$

$$|z| \geq 0$$

$$|z| = 0 \text{ if and only if } z = 0$$

### 1.3.3 Triangle Inequality

Triangle Inequality:

$$|z + w| \leq |z| + |w|$$

Reverse Triangle Inequality:

$$|z| - |w| \leq |z - w|$$

$$z = z - w + w \Rightarrow |z| = |z - w + w| \Rightarrow |z| \leq |z - w| + |w| \Rightarrow |z| - |w| \leq |z - w|.$$

### 1.3.4 Complex Division

With  $z\bar{z} \in \mathbb{R}$ , we can define complex division by reducing it to a multiplication problem.

$$\frac{z}{w} = \frac{z\bar{w}}{w\bar{w}} = \frac{1}{w\bar{w}}(z\bar{w})$$

We also have

$$\left|\frac{z}{w}\right| = \frac{|z|}{|w|} \text{ for } w \neq 0$$

### 1.3.5 Distance in the plane

A disk in the complex plane centered at  $c$  of radius  $r \in \mathbb{R}$  is of the form

$$\{z \in \mathbb{C} \mid |z - c| \leq r\}$$

## 1.4 Complex Polynomial

A complex polynomial  $p(z)$  of degree  $n$  is of the form:

$$p(z) = a_n z^n + a_{n-1} z^{n-1} + \dots + a_1 z + a_0$$

where  $a_n \neq 0$  and  $a_i \in \mathbb{C}$  for  $i = 0, \dots, n$

### 1.4.1 Fundamental Theorem of Algebra

The factorization of  $p(z)$  factors over  $\mathbb{C}$  is unique,

$$p(z) = c(z - z_1)^{m_1} \dots (z - z_k)^{m_k}$$

We have roots  $z_i \in \mathbb{C}$  of  $p(z)$  with order  $m_i \in \mathbb{N}$ .

For example, if  $p(z) = z^2 + 4 = (z + 2i)(z - 2i)$ , then it factors over  $\mathbb{C}$  but not  $\mathbb{R}$ .

**Note:**  $\mathbb{C}$  is an algebraically closed field, there are no irreducible polynomials in  $\mathbb{C}$ .

**Note:**  $\mathbb{R}, \mathbb{Q}, \mathbb{Z}, \mathbb{N}$  are not algebraically closed.

## 2 Geometry of the Complex Plane

### 2.1 Properties of Polar Forms

Complex numbers can be represented in polar forms:

$$z = |z|(\cos \theta + i \sin \theta)$$

with modulus  $|z|$  and argument  $\theta$ . To change between the coordinate systems it follows:

$$|z| = (a^2 + b^2)^{\frac{1}{2}}$$

$$\tan \theta = \frac{b}{a}$$

$$a = |z| \cos \theta = \Re(z)$$

$$b = |z| \sin \theta = \Im(z)$$

**Note:**  $\theta_R = \arctan(\frac{b}{a})$  is a reference angle of  $z$ . To find  $\theta$  from  $\theta_R$ , you need to consider the signs of  $a$  and  $b$ .  
Example:

$$z = -3 + 3i = 3\sqrt{2}(\cos \frac{3\pi}{4} + i \sin \frac{3\pi}{4})$$

$$\theta_R = \arctan(\frac{3}{-3}) = -\frac{\pi}{4}$$

$$\theta = \pi + \theta_R = \pi - \frac{\pi}{4} = \frac{3\pi}{4}, \text{ since } \theta \text{ is in } II.$$

### 2.2 Definition of Argument and argument

$\text{Arg}(z)$  is  $z$ 's principle polar angle  $\theta$ ,  $z \neq 0$ , where  $\theta \in (-\pi, \pi]$ .

$\arg(z)$  is all of  $z$ 's polar angles,  $\theta + 2k\pi$ ,  $k \in \mathbb{Z}$ .

### 2.3 Euler's Formula

Euler's Formula is defined as a linear combination of  $\cos \theta$  and  $\sin \theta$ ,  $\mathbb{R}$ -valued functions.

$$e^{i\theta} = \cos \theta + i \sin \theta$$

It allows us to express  $z$  in polar form by

$$z = |z|e^{i\theta}$$

-1 has polar angle  $\pi$  and modulus 1,

$$-1 = e^{i\pi} \text{ or } e^{i\pi} + 1 = 0$$

By the angle addition formulas from trigonometry we find:

$$e^{i\theta} e^{i\varphi} = e^{i(\theta+\varphi)}$$

$$(e^{i\theta})^k = e^{i\theta k}$$

### 2.4 Geometric Understanding of Multiplication

The polar angle of  $zw$  is the sum of the polar angles of  $z$  and  $w$ . The modulus is the product of the moduli.

$$\text{Arg}(zw) = \text{Arg}(z) + \text{Arg}(w)$$

$$\text{Arg}(\bar{z}) = -\text{Arg}(z)$$

Question: How about  $\frac{z}{w}$  and  $z^4$ ?

It follows from trigonometry that  $|e^{i\theta}| = 1$ , if  $\theta \in (-\pi, \pi]$  we get a parametrization of the unit circle.

**Example:** Discover all solutions to  $w^3 = i = z$

Let  $p(z) = w^3 - i$ . By Fundamental Theorem of Algebra, there are 3 roots of  $p(z)$ .

Therefore,  $3\theta = \frac{\pi}{2} + 2\pi k$ ,  $k \in \mathbb{Z}$

This gives us infinitely many solutions, but the solutions form 3 equivalence classes.

All we need is  $k = 0, 1, 2$ , which gives  $\theta_1 = \frac{\pi}{6}$ ,  $\theta_2 = \frac{5\pi}{6}$ ,  $\theta_3 = \frac{3\pi}{2}$

Our solutions partitioned the unit circle into 3 equally spaced wedges.

The solutions to  $w^3 = i$  are  $w_1 = \frac{\sqrt{3}}{2} + \frac{1}{2}i$ ,  $w_2 = -\frac{\sqrt{3}}{2} + \frac{1}{2}i$  and  $w_3 = -i$ .

This problem of unity can be extended to solving  $w^k = z$  for  $k \in \mathbb{N}$ ,  $z \in \mathbb{C}$  for unknown  $k$ -solutions  $w$ .

### 3 Stereographic Projections, Exponentials and Logs

#### 3.1 Stereographic Projections

We can express the complex plane on the unit sphere in  $\mathbb{R}^3$ . To perform this we project points on the surface of the sphere along the line from the North Pole  $(0, 0, 1)$  through the point and onto the plane  $z = 0, \mathbb{C}$

$$p_1 = (x_1, x_2, x_3) \rightarrow z = a + ib = \frac{x_1 + ix_2}{1 - x_3}$$

$$x_1 = \frac{2a}{|z|^2 + 1}, x_2 = \frac{2b}{|z|^2 + 1}, x_3 = \frac{|z|^2 - 1}{|z|^2 + 1}$$

Points in the northern hemisphere  $P_1$ , have  $|z_1| > 1$ ; while points in the southern hemisphere  $P_2$ , have  $|z_2| < 1$ .

##### 3.1.1 Mapping

$$\mathbb{S}^2 \rightarrow \mathbb{C}$$

$$N = (0, 0, 1) \rightarrow \infty$$

$$S = (0, 0, -1) \rightarrow 0$$

$$\text{lines of latitude} \rightarrow |z| = r, \text{ circles}$$

$$\text{lines of longitude} \rightarrow \text{Arg}(z) = \pm\theta, \text{ lines through } (0, 0)$$

**Note:** In general, circles on  $\mathbb{S}^2$  map to circles and lines in  $\mathbb{C}$ , orientation is not always preserved.

#### 3.2 Complex Logarithm

##### 3.2.1 Logarithm of Real Numbers

Anytime we are dealing with power, the log function is very useful.

$$\log x = \int_1^x \frac{1}{t} dt \text{ for } x \in \mathbb{R} \quad (1)$$

$$\frac{d}{dx} x^x = \frac{d}{dx} e^{\ln x^x} = \frac{d}{dx} e^{x \ln x} = e^{x \ln x} (x \cdot \frac{1}{x} + \ln x) = x^x (1 + \ln x)$$

##### 3.2.2 Logarithm of Complex Numbers

Remember from Euler's Formula,  $e^{i\theta} = \cos \theta + i \sin \theta$ .

$$e^z = e^{a+ib} = e^a e^{ib}$$

$$\text{Arg}(e^z) = b, |e^z| = e^a > 0$$

Therefore, if  $a$  is held fixed,  $e^z$  maps to a circle as  $b$  changes.

On the other hand, if  $b$  is held fixed,  $e^z$  maps to a line through  $(0, 0)$ .

##### 3.2.3 Derivation of Complex Logarithm

We want  $e^{\log(z)} = z$  for all  $z \neq 0$ , and thus

$$e^{\Re(\log(z)) + i\Im(\log(z))} = e^{\Re(\log(z))} e^{i\Im(\log(z))} = |z| e^{i\theta} = z$$

$$\Rightarrow |z| = e^{\Re(\log(z))}$$

$$\Rightarrow \Re(\log(z)) = \log |z|$$

From the imaginary part we find

$$e^{i\theta} = e^{i\Im(\log(z))}$$

$$\Rightarrow \arg(z) = \theta = \Im(\log(z))$$

$$\Rightarrow \Im(\log(z)) = \text{Arg}(z)$$

because  $\arg(z)$  is not well defined.

Our constructed inverse of  $e^z$  is a multi-valued function

$$\log(z) = \log |z| + i \arg(z)$$

### 3.2.4 Conclusion from Derivation

$$\log(z) = \log |z| + i \arg(z)$$

$$\operatorname{Log}(z) = \log |z| + i \operatorname{Arg}(z)$$

**Note:**  $\operatorname{Log}(z)$  does not have all the nice behavior as  $\mathbb{R}$ -valued  $\log(x)$ :  $\operatorname{Log}(z^k)$ .

Sometimes they are co-terminal angles, but they are not equal. See the following example:

$$\begin{cases} \operatorname{Log}(i^3) = \operatorname{Log}(-i) = -i\frac{\pi}{2} \\ 3\operatorname{Log}(i) = 3 \cdot (i\frac{\pi}{2}) = i\frac{3\pi}{2} \end{cases}$$

**Example:** Compute  $3^i$ :

$$3^i = e^{\operatorname{Log} 3^i} = e^{i \operatorname{Log} 3} = \cos(\operatorname{Log} 3) + i \sin(\operatorname{Log} 3)$$

### 3.2.5 How Logarithm acts on curves

$$\begin{cases} \text{Maps a circle with radius } r \text{ to a vertical line passing through } (\ln(r), 0) \\ \text{Maps a line with angle } \theta \text{ passing through the origin to a horizontal line passing through } (0, i\theta) \end{cases}$$

## 4 Topology in $\mathbb{C}$

### 4.1 Complex Sequence

Let  $\{Z_n\}$  be a sequence in  $\mathbb{C}$ .

#### 4.1.1 Cauchy Sequence

The sequence is Cauchy if for all  $\epsilon > 0$ , there is a  $N \in \mathbb{N}$  such that for all  $n, m > N$ ,  $|z_n - z_m| < \epsilon$ .

#### 4.1.2 Sequence Convergence

The sequence converges if  $|z_n - z| \rightarrow 0$  as  $n \rightarrow \infty$ . The distance between  $z_n$  and  $z$  vanishes.

#### 4.1.3 Completeness of $\mathbb{C}$

$\{z_n\}$  converges if and only if  $\{z_n\}$  is Cauchy.

**Proof:**

We show this by treating  $\mathbb{C}$  as  $\mathbb{R}^2$  and exploiting  $\{X_n\}$  converges if and only if  $\{X_n\}$  is Cauchy.

( $\implies$ ) (If  $z_n \rightarrow z$ , then  $\Re(z_n) \rightarrow \Re(z)$  and  $\Im(z_n) \rightarrow \Im(z)$ . Since the sequences of  $\mathbb{R}^2$  converge, they are Cauchy.

$$|Z_n - Z_m| \leq |\Re(Z_n - Z_m)| + |\Im(Z_n - Z_m)| = |\Re(Z_n) - \Re(Z_m)| + |\Im(Z_n) - \Im(Z_m)|$$

Upper bounds can be picked to be less than  $\frac{\epsilon}{2}$  for some  $N$ . Therefore,  $|Z_n - Z_m| \rightarrow 0$ .

( $\impliedby$ ) If  $\{Z_n\}$  is Cauchy, so are  $\{\Re(Z_n)\}$  and  $\{\Im(Z_n)\}$ . But these are  $\mathbb{R}$ -sequences that converge. Therefore,  $\{Z_n\}$  converges.

### 4.2 Complex Set

Let  $\Omega \subset \mathbb{C}$ . Sets can be open, closed, both, or neither.

#### 4.2.1 Open Set

If for any  $z_0 \in \mathbb{C}$ , there exist some  $\epsilon > 0$ , such that the set  $B_\epsilon(z_0) = \{z \mid |z - z_0| < \epsilon\}$  is contained in  $\Omega$ , then  $\Omega$  is open.

$\Omega$  is open if and only if  $\Omega^c$  is closed.

$\Omega$  is open if and only if  $\Omega$  is equal to its own interior, which means it does not contain its boundary points  $\partial\Omega$ .

#### 4.2.2 Closed Set

If  $\Omega$  contains its limit point, then  $\Omega$  is closed.

$\Omega$  is closed if and only if  $\Omega^c$  is open.

$\Omega$  is closed if and only if  $\Omega$  contains its boundary points.

#### 4.2.3 Compact Set

If  $\Omega$  can be contained in a disk of finite radius, then  $\Omega$  is bounded.

#### 4.2.4 Compact Set

If  $\Omega$  is closed and bounded, then  $\Omega$  is compact. This resembles  $[a, b]$  in  $\mathbb{R}$ .

#### 4.2.5 Connected Set

If any two points in  $\Omega$  can be connected by a path, then  $\Omega$  is connected.

Simply Connected Set: A simply connected set has no "holes" in it. For example,  $\Omega = \{z \mid |z - c| < 4\}$ .

A connected but not simply connected set is an annulus,  $\Omega = \{z \mid 2 < |z - c| < 4\}$

#### 4.2.6 Boundary of Set

The boundary of  $\Omega$ ,  $\partial\Omega$  is all points with  $\epsilon$ -balls intersecting  $\Omega$  and  $\Omega^c$  for all  $\epsilon > 0$ .

#### 4.2.7 Interior of Set

The interior of  $\Omega$ ,  $\text{Int}(\Omega)$ , is all points in  $\Omega$  with a  $\epsilon$ -ball contained in  $\Omega$  for some  $\epsilon > 0$ . "Largest open set in  $\Omega$ ".

#### 4.2.8 Closure of Set

The closure of  $\Omega$  is the union of  $\Omega$  and its boundary  $\partial\Omega$ .

#### 4.2.9 Domain

If a set is open and connected in  $\mathbb{C}$ , it is a domain.

A domain can be traversed by a path of horizontal and vertical line segments.

## Chapter 1: Algebra in C

$$f(x) = x^2$$

this formula is an example  $f(x) = x$

$$1 + 2 = 3$$

$$1 = 3 - 2$$

$$f(x) = x^2$$

$$g(x) = \frac{1}{x}$$

$$h(x) = \int_b^a \frac{1}{x} x^3$$

$$F(x) = \frac{1}{\sqrt{x}}$$

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$\left( \frac{1}{\sqrt{x}} \right)$$

Core Material: 1. Finding patterns in data; using them to make predictions. 2. Models and statistics help us understand patterns. 3. Optimization algorithms "learn" the patterns.  
Classification: 1.
